Provider Profile	21

Report Author: Pedro L Bicudo Maschio

Compliance, agility and cost are driving the market

The mainframe market findings for 2023 are in line with client priorities identified in 2022 when ISG interviewed a group of ISG client executives in the U.S. to understand how the macroeconomic climate impacts their spending plans on technology services. The clients represented multiple industries, including insurance, retail, manufacturing and energy. Most clients are reprioritizing their technology budgets to focus on investments that produce results in the short term. At the same time, almost all organizations recognize the importance of technology modernization.

Trends in mainframe modernization are similar across all countries in the Americas because IBM and Unisys, the major suppliers of mainframe technology, support clients seamlessly across the region. In 2022, mainframe clients increased outsourcing and

accelerated their mainframe modernization plans. Outsourcing enables clients to assess their spending and find opportunities to optimize operations, replace middleware tools and add automation. When opting for a mainframe-as-a-service (MFaaS) deal, additional savings are from opting for a shared environment and gains of scale that reduce licensing costs.

Modernization can provide additional benefits, and either starts with outsourcing or is set into motion after that. Modernizing applications running on mainframes improves application performance and reduces MIPS requirements, further reducing costs. New data solutions, such as the ones provided by Model9 and Precisely, can facilitate mainframe data access, enabling clients to move data from expensive mainframe storage to low-cost cloud storage, but without the need to replace or modify mainframe applications.

A few enterprises modernize COBOL to insert APIs and DevOps, with percentage utilization under 15 percent – the same trend observed in previous years. The new trend in mainframe

ESG is impacting
mainframe
modernization
demand.

modernization is data integration, with bi-directional integration or ETL to use analytics in the cloud. Data analytics continue to drive demand for mainframe modernizations.

Data analytics continue to drive demand for mainframe modernization. Mainframe migrations to the cloud have accelerated. Hyperscalers continue to invest in marketing and in developing partners' capabilities. AWS and Google are more active in promoting partner capabilities and in incentivizing clients to take modernization initiatives, in comparison with Azure that is not as intense in marketing, but equally relevant as a cloud destination.

Besides data access and cost savings, migrations to the cloud enable enterprises to standardize their application portfolio development workbench. Converted applications use the same DevOps and continuous integration tools, improving the agility and quality of the applications.

ESG is impacting mainframe modernization demand. Mainframe hardware can be energy efficient, but its surrounding technology is not. Also, updating client-owned data centers to

comply with changing regulations can have cost implications. By migrating applications to the cloud, enterprises benefit from locations that use clean energy and are certified carbon neutral. Most cloud data centers do not meet this requirement, but all hyperscalers have committed to meeting their ESG targets before 2030. Concerns and regulations around environmental control vary by country; it is more important in the U.S., with a minor impact in Brazil.

The governance aspect of ESG is also pushing modernization. To comply with regulations around data availability, location and sovereignty, auditors may have doubts about the ability of legacy applications to meet privacy, data loss prevention, location and access control requirements. The old answer that mainframes are secure is not adequate for certification; the doubt surrounds the application. Most enterprises do not have the documentation or test cases to prove compliance. In some particular cases, data originating in one country should not be accessed, stored or processed in another. Replicating the mainframe in many locations

to comply with regulations would be extremely expensive, but refactoring the applications to run in the cloud can be fast and involve low risk, besides producing the documentation and tests to prove compliance.

The cloud has proven to provide better scalability and performance than mainframes, with the additional benefit that it enables easy replication in different cloud regions, thus ensuring higher availability and business resilience.

Mainframe migration to the cloud involves cost reductions, technology modernization, controlled data access and compliance with increasing ESG regulations. Service providers have accumulated many success cases to predict the time required for modernization, ensure transparency on cost and risk factors, and have the required controls for incremental modernizations.

The providers of mainframe migrations to cloud are experiencing growth beyond their expectations. Any obstacles in expansion arise from the need for training and educating more practitioners to operate the application

refactoring tools. Tools are innovative and use high-end technology and sophisticated software engineering methodologies.

The market is characterized by three modernization strategies:

- **Replatforming** adjusts an application code to run on emulators in the cloud or uses compilers to build executable code that runs natively on cloud virtual machines. This approach simplifies the process and can be scaled fast. However, legacy application source codes remain untouched and are not modernized.
- **Rewriting** uses compilers and translators to convert legacy languages to new ones, usually Java, C# or .Net. This approach retains application logic and behavior. Most tools generate readable and maintainable code, allowing clients to maintain applications in the new language. A few solutions do not generate a readable code and all subsequent changes are made in the legacy source code. Rewriting is popular among vendors.

- **Reengineering** uses automated assessment tools that extract business rules and design the application flow, which is useful for documentation. It creates code requirements that AI-assisted tools interpret to write a new code. The full process is automated but manual intervention is needed to correct the interpretations used to write the new code.

All methods require data extraction from the mainframe databases and for files to be loaded into new databases and cloud storage. Testing automation is fundamental for success and risk control. Vendors run tests multiple times to achieve success. Tests need to include application, performance and database conversion.

Many vendors and service providers compare the cost of mainframe infrastructure with cloud infrastructure. It is noted that mainframe system, database and storage licensing comprise most of the savings from any modernization initiative.

These factors, among other drivers, impact the modernization software market.

Vendors are passionate about their solutions and often tend to overlook their limitations. Clients should always prioritize consulting, project management and risk management to bring projects that do not deliver the desired outcomes to a stop. No single tool can address all legacy languages and modernization options, requiring clients to select a toolset that involves several vendors.

A cloud infrastructure offers high performance and scale to run sophisticated modernization tools, where vendors use cloud capacity to further improve their tools. A major innovation this year is Google Dual Run, a solution developed in partnership with Micro Focus that enables clients to compare a mainframe application in production with the same application running on Google Cloud. It is not a simple setup, but has proven to be valuable to highlight application performance, integration and accuracy before removing the application from the mainframe.

AWS announced its mainframe migration service in 2022. It aims to leverage the AWS Marketplace to deliver Everything as a Service,

including modernization tools and consulting services. The company is assessing and certifying partners to ensure usability, capacity and the quality of outcomes and service levels.

The focused activities of the hyperscalers in the mainframe modernization market portends that it will continue to accelerate, with mainframes gradually moving to the cloud. It is too early to say that all mainframes will migrate. At the current pace of migration it would take years, perhaps more than a decade, to migrate all mainframes. However, small modifications in IBM licensing terms and hardware prices could change the game entirely.

Data analytics continue to drive demand for mainframe modernization.

Mainframe Modernization Services

Mainframe Application Modernization and Transformation Services, U.S.

Mainframe Application Modernization and Transformation Services, Brazil

Mainframe as a Service (MFaaS)

Mainframe Operations

Mainframe Application Modernization Software

Definition

Digital business transformation has been pushing companies to become more agile in adapting to market changes. The cloud provides the core agility elements, including cloud-native AI, machine learning, serverless computing, database as a service, data services, full automation and many SaaS options to improve business performance.

The more advanced enterprises are prioritizing mainframe modernization. Mainframe systems are complex and slow to change, thus pushing back against agility. These enterprises have two options. They can migrate their legacy applications to the cloud or adapt the old applications with APIs, microservices and DevOps.

Mainframe systems combine high-performance hardware, software tools, and large, individually programmed applications that are complex to replace. Thus, modernization is not a trivial task.

The market offers automation tools to transform legacy applications, without loss in functionality, into new ones in the cloud.

Such solutions enable the standardization of application languages and databases, including open-source tools.

However, many enterprises are not ready for a full exit from mainframes. They may prefer outsourcing or pay-as-you-go (PAYG) models to enable mainframe-as-a-service – thus running their legacy applications on cloud-like mainframe data centers.

This study assesses service providers that modernize mainframe applications or convert applications to run in the cloud, and those that offer mainframe outsourcing and MFaaS. Software vendors of automation tools for refactoring, rehosting, replatforming, rewriting and reengineering applications are also evaluated.

Scope of the Report

In this ISG Provider Lens™ quadrant study, ISG includes the following five quadrants: Mainframe Modernization Services; Mainframe Application Modernization and Transformation Services; Mainframe as a Service (MFaaS); Mainframe Operations; and Mainframe Application Modernization Software.

The trends identified and other findings largely apply across the region. However, ISG did add a national quadrant analysis on Mainframe Application Modernization and Transformation Services for Brazil because of specific market conditions there.

This ISG Provider Lens™ study offers IT-decision makers:

- Transparency on the strengths and weaknesses of relevant providers and software vendors
- A differentiated positioning of providers by segments
- Focus on regional markets

ISG studies serve as the basis for important decision-making in terms of positioning, key relationships and go-to-market considerations. ISG advisors and enterprise clients also use information from these reports to evaluate their existing vendor relationships and potential engagements.

Provider Classifications

The provider position reflects the suitability of IT providers and software vendors for a defined market segment (quadrant). Without further additions, the position always applies to all company sizes classes and industries. In case the IT service requirements from enterprise customers differ and the spectrum of IT providers operating in the local market is sufficiently wide, a further differentiation of the IT providers by performance is made according to the target group for products and services. In doing so, ISG either considers the industry requirements or the number of employees, as well as the corporate structures of customers and positions IT providers according to their focus area. As a result, ISG differentiates them, if necessary, into two client target groups that are defined as follows:

- **Midmarket:** Companies with 100 to 4,999 employees or revenues between \$20 million and \$999 million with central headquarters in the respective country, usually privately owned.
- **Large Accounts:** Multinational companies with 5,000 or more employees or revenue above US\$1 billion, with activities worldwide and globally distributed decision-making structures.

The ISG Provider Lens™ quadrants are created using an evaluation matrix containing four segments (Leader, Product Challenger, Market Challenger and Contender), and the providers are positioned accordingly. Each ISG Provider Lens quadrant may include a service provider(s) which ISG believes has strong potential to move into the Leader quadrant. This type of provider can be classified as a Rising Star.

Number of providers in each quadrant: ISG rates and positions the most relevant providers according to the scope of the report for each quadrant and limits the maximum of providers per quadrant to 25 (exceptions are possible).

Provider Classifications: Quadrant Key

Product Challengers offer a product and service portfolio that reflect excellent service and technology stacks. These providers and vendors deliver an unmatched broad and deep range of capabilities. They show evidence of investing to enhance their market presence and competitive strengths.

Contenders offer services and products meeting the evaluation criteria that qualifies them to be included in the IPL quadrant. These promising service providers or vendors show evidence of rapidly investing in products/ services and a follow sensible market approach with a goal of becoming a Product or Market Challenger within 12 to 18 months.

Leaders have a comprehensive product and service offering, a strong market presence and established competitive position. The product portfolios and competitive strategies of Leaders are strongly positioned to win business in the markets covered by the study. The Leaders also represent innovative strength and competitive stability.

Market Challengers have a strong presence in the market and offer a significant edge over other vendors and providers based on competitive strength. Often, Market Challengers are the established and well-known vendors in the regions or vertical markets covered in the study.

★ **Rising Stars** have promising portfolios or the market experience to become a Leader, including the required roadmap and adequate focus on key market trends and customer requirements. Rising Stars also have excellent management and understanding of the local market in the studied region. These vendors and service providers give evidence of significant progress toward their goals in the last 12 months. ISG expects Rising Stars to reach the Leader quadrant within the next 12 to 24 months if they continue their delivery of above-average market impact and strength of innovation.

Not in means the service provider or vendor was not included in this quadrant. Among the possible reasons for this designation: ISG could not obtain enough information to position the company; the company does not provide the relevant service or solution as defined for each quadrant of a study; or the company did not meet the eligibility criteria for the study quadrant. Omission from the quadrant does not imply that the service provider or vendor does not offer or plan to offer this service or solution.

Mainframe Modernization Services

Who Should Read This Section

This report is relevant to enterprises in the U.S. for evaluating providers of mainframe modernization services.

In this quadrant, ISG assesses providers of legacy mainframe modernization. It also evaluates providers that offer code repositories such as GitHub or equivalents, DevOps integration and testing automation and security testing.

Enterprises are focusing on modernizing their core mainframes and other existing systems for competitive differentiation, which is leading to an increased emphasis on digital transformation. Most enterprises are also facing the challenge of having consistent access to the right IT talent in house to manage their legacy systems. Service providers can modernize the mainframes of clients with various tool vendors and can deliver consulting, planning and management expertise to ensure project success.

In recent times, mainframe service providers have focused on offering a full-fledged modernization strategy to best suit a business, including offering consultation on the resources to be terminated and the applications to be kept in the mainframe. Enterprises investing in mainframe modernization look for providers that have a thorough understanding of their exact business requirements and can determine the stage of modernization they are in with respect to core processes.

CIOs should read this report to understand the strengths and weaknesses of providers, including the way they employ the latest technologies to deliver reliable offerings.

CTOs should read this report to understand the mainframe modernization capabilities of providers to ensure suitable technology integration into products, services and business administration.

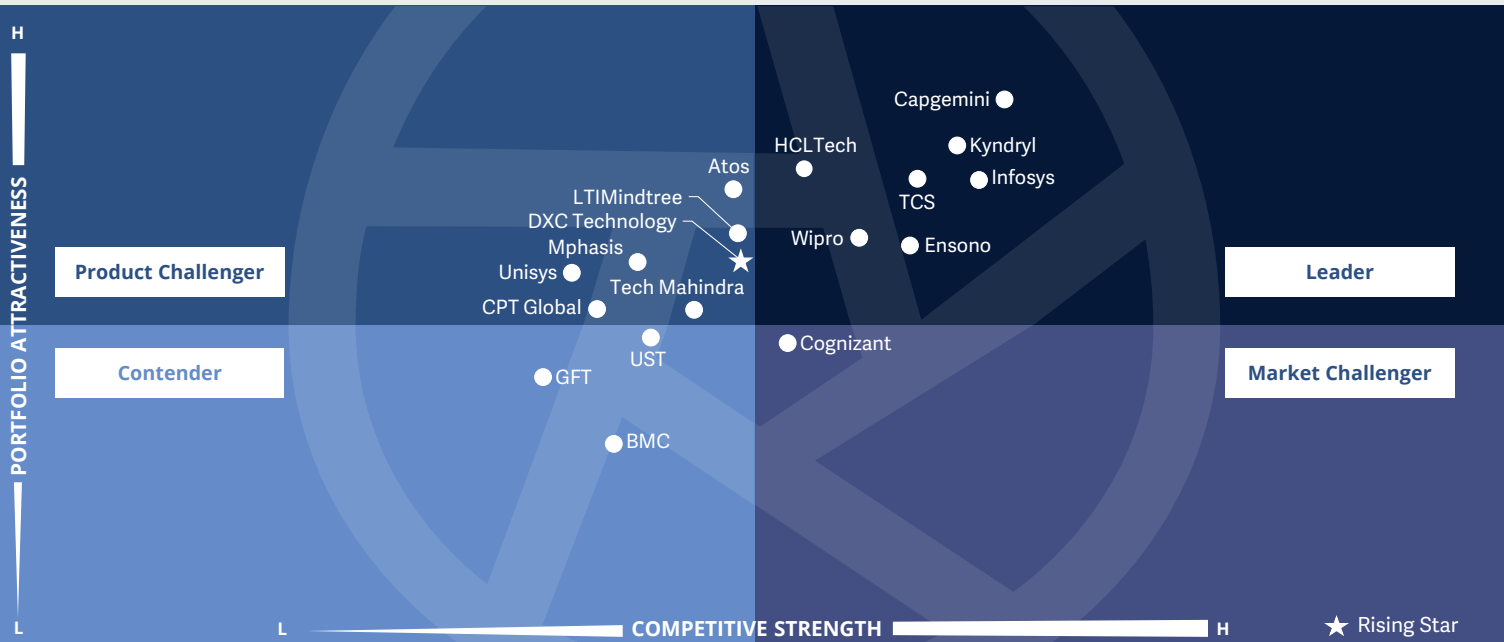

Tech leaders should read this report to understand the competing providers in the mainframe market, in terms of their offerings, innovations and talent.

Mainframes – Services and Solutions
Mainframe Modernization Services

U.S. 2023

This quadrant assesses providers of mainframe **modernization services** to clients that continue to run their **applications on mainframes**.

Pedro L Bicudo Maschio

Mainframe Modernization Services

Definition

Service providers in this quadrant offer mainframe application modernization and can introduce code repositories such as GitHub or equivalents, DevOps integration and testing automation, and security testing. Modernization retains the original programming language, such as COBOL, adding architecture optimization and documentation to enable agility. After the modernization is complete, clients can embrace agile methodologies to develop and maintain applications running on mainframe systems, including code repositories, quality assurance and DevOps.

These providers can assess a client's application portfolio to deliver a modernization plan with guidance on what applications should be retained on the mainframe platform. They also help enterprises decide on the type of applications that can be transformed and migrated to other platforms, thus enabling cost and performance optimization.

Eligibility Criteria

1. The participant should provide **case studies** around mainframe modernization of either IBM Z, IBM AS/400, IBM iSeries, HP, Cray, Fujitsu or Unisys mainframe applications.
2. Case studies must include **DevOps tools integration**, including code repository.
3. Modernization must enable legacy programming languages to build and deploy in line with modern **continuous integration** and deployment best practices (for example, implementation of COBOL CI/CD pipelines).
4. Services must include **portfolio and application assessments**.
5. Ideally, the provider can plan for phased modernization with robust testing and quality assurance.
6. The provider **can decouple applications**, develop APIs and integrate with applications outside the mainframe environment.
7. The provider offers guidance for future-state application **governance**.
8. The provider delivers services with its own employees, with adequate **expertise in COBOL** and other mainframe programming languages. It does not subcontract this core competency.

Mainframe Modernization Services

Observations

As in 2022, AI and machine learning capabilities continue to push the demand for data services. However, in many cases, data is locked in mainframes. Application modernization includes data access through APIs and more agile development practices to enable IT to respond quickly to business demands.

ISG observes a reduction in references to Zowe™, the integrated and extensible open-source framework promoted by IBM. Instead, ISG notes the emergence of integration platforms such as Kyndryl's data pipes in partnership with Microsoft Azure and vendors such as model9, mLogica, Micro Focus and TmaxSoft that offer tools to synchronize mainframe and cloud data. Most service providers in this quadrant offer solutions for data integration using proprietary and commercial solutions and a few still support Zowe™.

Data from providers that responded to this year's survey show that the percentage of mainframe clients that have modernized their

applications is still low, with 10 percent using DevOps, 12 percent having APIs and 8 percent using Java on z/OS.

From the 56 companies assessed for this study, 18 have qualified for this quadrant with seven being Leaders and one a Rising Star.

Capgemini has long been operating in the U.S. and offering mainframe services. It has accumulated experience, and can claim a strong partnership with IBM and a robust offshoring capacity to serve large accounts and support them to optimize and modernize their mainframes.

Ensono

Ensono has a strong focus on attracting new clients and has a solid track record of winning deals. It focuses on modernizations to reduce MIPS utilization and costs for clients migrating to Ensono's data centers. It is agile and responsive in addressing service issues, and has a major presence in the midmarket.

HCLTech

HCLTech invests in R&D to offer advanced tools. It works closely with IBM in enabling mainframe modernization. It focuses on automation and uses advanced tools to assess clients' portfolios and enable optimization and technical debt reduction. Its fabric approach is best suited for large application portfolios that can benefit from automation.

Infosys offers a complete modernization portfolio, delivered by a robust team of experts. It has more than 26,000 mainframe experts in the U.S. and India to support large modernizations. Its optimization approach includes middleware replacement, license optimization and COBOL upgrades, besides DevOps and application modernization.

Kyndryl

Kyndryl has the largest mainframe installed base, providing it with exposure to diversity and innovations. It supports both midmarket and large accounts. It can introduce agile practices and tools into clients' mainframe development workbenches, with differentiated capacity in automation and cloud integration, enabling high-performance hybrid environments.

TCS hosts a mainframe lab for clients' experimentation and focuses on large accounts. It nurtures innovation in collaboration with clients, IBM and other vendors. Application modernization includes DevOps and automation of development and production environments. It helps clients explore the many possibilities of modernization, including cloud service integrations.

Mainframe Modernization Services

Wipro leverages the ModerniZ framework to help clients identify the best modernization path in alignment with business goals. It engages in long-term commitments, enabling continuous quality improvements, including code quality, DevOps, automation and cloud integrations. Wipro has a large footprint in the U.S., with a major focus on large accounts.

DXC Technology is a Rising Star for its revitalized go-to-market strategies that enable it to experiment with new growth opportunities in the mainframe modernization space. It offers deep expertise in IBM technologies to help clients upgrade legacy languages, fine-tune operations, improve automation and use DevOps, APIs and data services.

“DXC Technology has a long tradition in providing mainframe services to deliver outstanding modernizations.”

Pedro L Bicudo Maschio

DXC Technology

Overview

DXC Technology is headquartered in Virginia, U.S, and operates in 70 countries. It has more than 130,000 employees across 130 global offices. In FY22, the company generated \$16.3 billion in revenue of which 29 percent was contributed by the U.S. The company has a large data center footprint in the U.S. and a mature application modernization practice. In 2022, it reported increasing activities in its mainframe modernization practice, which has enabled it to achieve a position as a Rising Star.

Strengths

Full-scope portfolio: DXC Technology’s comprehensive mainframe modernization includes developing a definitive improvement roadmap. It inspects the client’s code quality by using automation and partner tools. DXC Technology leverages detailed information for fact-based decisions and to update clients’ system architectures, mainframe APIs and microservices to future-proof mainframe applications.

Optimization focus: DXC Technology guides clients through hardware, software and application upgrades, highlighting the options that would ensure the most value from their investments. It can predict capacity growth and shorten batch windows, and has the ability to rewrite and recompile COBOL to optimize code performance.

Clear differentiation: DXC Technology’s large mainframe organization enables clients to access niche skills for specific needs. Its project management experts help reduce risks associated with data migration, security and testing. The company’s long experience in quality assurance provides additional support. Resource availability, offshoring capacity and proprietary tools further complement this differentiation.

Caution

DXC Technology serves many mainframe clients, which has allowed it to grow its modernization practice atop its installed base. However, it is yet to become an attractive option for midmarket clients that run mainframes on-premises.

Appendix

The ISG Provider Lens™ 2023 Mainframes – Services and Solutions analyzes the relevant software vendors/service providers in the Americas, based on a multi-phased research and analysis process, and positions these providers based on the ISG Research methodology.

Information Services Group Inc. is solely responsible for the content of this report. Unless otherwise cited, all content, including illustrations, research, conclusions, assertions and positions contained in this report were developed by, and are the sole property of Information Services Group Inc.

The research and analysis presented in this report includes research from the ISG Provider Lens program, ongoing ISG Research programs, interviews with ISG advisors, briefings with services providers and analysis of publicly available market information from multiple sources. The data collected for this report represents information that ISG believes to be current as of December 2022, for providers who actively participated as well as for providers who did not. ISG recognizes that many mergers and acquisitions have taken place since that time, but those changes are not reflected in this report.

All revenue references are in U.S. dollars (\$US) unless noted.

The study was divided into the following steps:

1. Definition of Mainframes – Services and Solutions market
2. Use of questionnaire-based surveys of service providers/ vendor across all trend topics
3. Interactive discussions with service providers/vendors on capabilities & use cases
4. Leverage ISG's internal databases & advisor knowledge & experience (wherever applicable)
5. Use of Star of Excellence CX-Data
6. Detailed analysis & evaluation of services & service documentation based on the facts & figures received from providers & other sources.
7. Use of the following key evaluation criteria:
 - * Strategy & vision
 - * Tech Innovation
 - * Brand awareness and presence in the market
 - * Sales and partner landscape
 - * Breadth and depth of portfolio of services offered
 - * CX and Recommendation

Author & Editor Biographies

Lead Author

Pedro L. Bicudo Maschio
Lead Author

Distinguished analyst and author, Pedro Maschio brings extensive experience in the research of the SEMEA (Southern Europe Middle East and Africa) and Latin America service markets. With more than 30 years of experience in sourcing, he has developed vendor assessments plus contract restructuring, services scope and IT benchmarking programs for diverse vertical markets in the Americas and APAC.

Before joining ISG, Pedro was a partner of TGT Consult and managing vice president at Gartner Inc., responsible for the consulting business in APAC and Latin America.

Lead Author

Manoj M
Research Analyst

Manoj is a research analyst at ISG and supports ISG Provider Lens™ studies on Mainframes Services & Solutions, Cloud Native Services & Solutions and Public Cloud Data Center Solution and Services. He also supports the lead analysts of multiple regions in the research process. Prior to this role, he supported the ROI process in the sales intelligence platform and was an individual contributor in

handling research requirements for advanced technologies in different sectors. He has considerable expertise in predicting the automation impact by considering certain parameters such as productivity, efficiency and time reduction. During his tenure, he has supported research authors and authored Enterprise Context and Global Summary reports with market trends and insights.

IPL Product Owner

Jan Erik Aase
Partner and Global Head – ISG Provider Lens™

Mr. Aase brings extensive experience in the implementation and research of service integration and management of both IT and business processes. With over 35 years of experience, he is highly skilled at analyzing vendor governance trends and methodologies, identifying inefficiencies in current processes, and advising the industry. Jan Erik has experience on all four sides of the sourcing and vendor governance lifecycle - as a client, an industry analyst, a service provider and an advisor.

Now as a research director, principal analyst and global head of ISG Provider Lens™, he is very well positioned to assess and report on the state of the industry and make recommendations for both enterprises and service provider clients.

iSG Provider Lens™

The ISG Provider Lens™ Quadrant research series is the only service provider evaluation of its kind to combine empirical, data-driven research and market analysis with the real-world experience and observations of ISG's global advisory team. Enterprises will find a wealth of detailed data and market analysis to help guide their selection of appropriate sourcing partners, while ISG advisors use the reports to validate their own market knowledge and make recommendations to ISG's enterprise clients. The research currently covers providers offering their services across multiple geographies globally.

For more information about ISG Provider Lens research, please visit this [webpage](#).

iSG Research™

ISG Research™ provides subscription research, advisory consulting and executive event services focused on market trends and disruptive technologies driving change in business computing. ISG Research delivers guidance that helps businesses accelerate growth and create more value.

ISG offers research specifically about providers to state and local governments (including counties, cities) as well as higher education institutions. Visit: [Public Sector](#).
